

BytePlus Overview

Dec, 2025

Define Tomorrow AI-Powered

BytePlus is an enterprise AI platform that helps developers build AI agents at scale.

As the enterprise services arm of ByteDance, BytePlus delivers cutting-edge models, multimodal intelligence, and AI computing optimized infrastructure in a modular stack. BytePlus powers vertical-specific use cases across discovery, interaction, and conversion.

We combine scale, agility, and enterprise precision — turning AI ambition into impact.

AI Powered Infrastructure

International Roadmap

- Progressing: Saudi
- Planning : Latin, Japan, Europe

Capability

- Large Models and AI tools
- Agent Development and Orchestration
- Edge and Video Cloud
- Large scale and high available Infrastructure

BytePlus Global PoP Network

With 1,300+ Global PoPs and 110 Tbps of available capacity

BytePlus AI Native Infrastructure

Seed 1.8

- **Stronger Agentic Capabilities:** Tool calling capability, long-text and multi-turn instruction following; more stable formatted output
- **Super Multimodal Understanding:** Long-video comprehension, video motion understanding, complex spatial understanding, structured document parsing
- **More Flexible Context Management:** 256K context window, native API-based context management, excellent at complex multi-step tasks

Motion understanding

Long video understanding

Seedance 1.5 Pro

Seedream 4.5

Seedream 4.5 achieves an all-round improvement through the overall scaling of the model. It accurately identifies the main subjects in multi-image editing, strictly preserves the details of the reference images and further enhances the typography and dense text rendering capabilities, so that it can deliver professional visual creatives with high consistency and fidelity.

OmniHuman 1.5

Single/Multi-Person Scene Performance

The model framework extends to complex multi-person scenarios. It generates dynamic performances by routing separate audio tracks to the correct character in a single frame, supporting both the specification of a speaker and joint performances.

Rhythmic Performance

The flexibility of the model extends to the music field. The algorithm can create emotional digital singers using only a single image and a song. Driven by our inference module, movements are not limited to simple lip-sync—they also include natural pauses and rhythmic variations, enabling flexible adaptation to various styles, from solo lyrical songs to lively concert performances.

Emotional Performance

Using only a single image and a piece of audio, the model can bring digital actors "to life". By analyzing the emotional connotation of the audio (no text prompt required), it generates engaging, cinematic performances that cover a full range of dramatic expressions, from intense anger to sincere confessions.

OmniHuman 1.5

Context Awareness

By parsing the semantic context of the audio, our model goes beyond simple lip-sync and repetitive movements. It enables characters to exhibit authentic emotional changes, and aligns their movements with their words and intentions—as if they have their own will.

Text-Guided Multimodal Performance

The carefully designed algorithm framework accepts text prompts and demonstrates excellent prompt-following capabilities. This allows precise control over object generation, camera movements, and specific actions while maintaining perfect audio synchronization.

Support for Diverse Subjects

The model exhibits excellent robustness and covers an incredibly wide range of subjects, including real animals, anthropomorphic characters, and stylized cartoons.

HiAgent

HiAgent is an Enterprise-grade agent orchestration platform. HiAgent is based on the Agent DevOps philosophy, providing full lifecycle management for agent development, evaluation, monitoring, and optimization, supporting model access, inference and training. HiAgent helps enterprises efficiently build production-grade high-value agents.
